Kshitij Dashboards

A. Primary metric (show first)

FP × Practice Depth Distribution (Heatmap)

We have this already and it is the *correct backbone*.

Why this works:

- Shows where practice actually lives
- Makes **D4 scarcity** visible
- Immediately reveals intent–practice gaps
- Is non-judgmental and diagnostic

Example say for FP 2, the question becomes:

"Is FP-2 living in D1/D2 or migrating toward D3/D4?"

That is *exactly* the NEP question.

B. Secondary metric (for comparison & tracking)

Depth-Adjusted FP Index (DA-FP Index)

Define:

$DA\text{-}FP_k = \sum_{k=0}^{4} nki \times wi / Nk \times wmax(k)$

Where:

- kkk = FP (1…5)
- nk,in_{k,i}nk,i = responses for FP-k at depth Di
- wiw_iwi = depth weight (1–4)
- NkN_kNk = total FP-k responses
- wmax(k) = **maximum observable depth weight** for that FP (FP1 – 2 and FP2 – 3)

This normalises everything to **0–1**.

Interpretation:

- 0.25–0.40 → Procedural dominance
- 0.40–0.60 → Responsive / early diagnostic
- 0.60–0.80 → Diagnostic strength
- >0.80 → Adaptive practice (rare, aspirational)

This is the number we can:

- Trend over time
- Compare across schools
- Use for intervention prioritisation

Level 1 – Diagnostic view (core) - FP × Depth heatmap (cohort-level)

Level 2 – Index view (decision-making) - DA-FP Index per FP (0–1 scale)

Level 3 – Narrative insight -One line per FP:

- High intent, low depth
- Emerging diagnostic
- Practice-led strength

Why FP1–D1 and FP1–D4 are not observable in the current instrument

The current instrument was intentionally designed to surface **meaningful instructional choices**, not compliance-level or aspirational statements. As a result, two FP1 depth bands-**D1 (Procedural)** and **D4 (Adaptive)** are not directly observable.

FP1–D1 (Procedural individualisation) is not observable by design

FP1–D1 would represent **rule-based, surface-level differentiation**, such as:

- Labelling students as "weak/strong"
- Applying fixed rules ("slow learners get extra homework")
- Treating individual differences as static traits

In the current instrument, such responses are **deliberately tagged under FP2 (Holistic & Experiential) at D1**, because they reflect **generic instructional adjustments**, not a principled view of learner uniqueness.

Therefore, the absence of FP1-D1 does **not** imply teachers never act procedurally around individual differences; it reflects a **design decision to avoid legitimising procedural labelling as FP1-aligned practice**.

FP1–D4 (Adaptive differentiation) is not observable

FP1–D4 would require evidence of **intentional redesign of instruction** based on learner profiles, such as:

- Parallel learning pathways
- Tiered tasks or outcomes
- Flexible pacing or grouping planned in advance

While the instrument captures:

- Responsive support (FP1–D2)
- Diagnostic attention to learner differences (FP1–D3)

it does not include items that test **structural redesign of learning experiences**, which is the defining feature of D4.

As a result, FP1–D4 is methodologically **out of scope** for this instrument version.

Why FP2–D4 (Adaptive Holistic & Experiential Practice) is not observable in the current instrument

FP2–D4 would represent **adaptive, intentionally redesigned pedagogy**-where teachers restructure learning experiences (tasks, sequences, pacing, or contexts)

based on ongoing classroom signals, rather than applying predefined experiential methods.

In the current instrument, FP2 items are designed to capture:

- Procedural enactment of experiential methods (FP2–D1), such as completing activities or worksheets
- Competency-oriented planning and application (FP2–D3), such as real-life tasks and skill-focused lessons

However, none of the items test whether teachers **redesign the structure of learning itself**—for example:

- Re-sequencing a unit mid-way
- Creating alternate activity pathways for the same competency
- Redesigning tasks based on observed transfer failures

Such behaviours define **D4 (Adaptive)** depth, but are **intentionally not**

Design intent behind excluding FP2–D4

The current instrument prioritises:

- Observable, repeatable classroom decisions
- Everyday practice signals, not exceptional or aspirational behaviour
- Conservative estimation of NEP readiness

Adaptive pedagogical redesign (FP2–D4) typically emerges:

- After sustained reflection
- With curricular autonomy
- Through intentional experimentation

These conditions are not uniformly available across school contexts, and therefore were **deliberately excluded from the measurement**.
