Project क्षितिज (Kshitij)- Micro-intervention, task tracing and data- Expected impact on SRI

(Assume sample size: ~200 teachers)

Why this data matters for SRI

SRI is designed as a **structured synthesis of signals**, not a test score. Micro-task participation data adds value by grounding **orientation and early practice signals** in **observed behaviour over time**, rather than relying solely on self-reported intent or one-time diagnostics.

Importantly, this data:

- does **not** measure teaching quality,
- does **not** claim practice depth shifts,
- but **does** reveal *what kind of NEP-aligned change is currently possible*.

Micro-Intervention Tasks → SRI constructs → signal it creates (and what it does NOT claim)

Task → SRI correlation (Canonical Mapping)

- Task ≠ Outcome
- Task = Signal opportunity
- Multiple tasks may feed the same SRI area
- One task may touch multiple areas, but with different signal strengths

Table: micro-tasks → SRI Signal Types → Readiness Constructs

Task #	Task (Short)	Primary SRI Signal Type	Secondary Signal	Readiness Construct Affected
1	Notice one learner	Orientation Signal (FP1)	Practice Trajectory	Intent Readiness

2	One adjustment	Practice Depth (early D1/D2)	Practice Trajectory	Practice Readiness
3	Change example	Orientation (FP2)	Practice Depth	Intent → Practice Readiness
4	Ask why / how	Orientation (FP4)	Practice Depth	Intent Readiness
5	End reflection	Practice Trajectory Signal	—	Practice Readiness
6	Try small change	Practice Trajectory	Practice Depth	Practice Readiness
7	Quick check	Orientation (FP4)	Practice Depth	Intent → Practice Readiness
8	Spot a pattern	Practice Trajectory	—	Practice Readiness
9	Teacher touchpoint	Orientation (FP5)	System Enablement	System Readiness
10	Parent signal	Validation Signal	—	Ecosystem Readiness
11	Student voice	Orientation (FP1 / FP4)	Practice Trajectory	Intent Readiness
12	Pause & name	Orientation (FP1)	Practice Depth	Intent Readiness

Micro-intervention task logs contribute **only to orientation signals and early practice trajectory signals**. They do **not** represent practice depth movement, cognitive capacity, or impact. **Change in practice depth movement will be measured through student diagnostic signals and parent experience signals.**

What are we measuring (and why)

We measure three things only-everything else is derivative.

1. Participation → *Is the teacher willing to enter the loop?*
2. Consistency → *Is the loop becoming a habit?*
3. Signal stretch → *Is the teacher moving beyond comfort?*

We do not measure "quality", "impact", or "depth" here.

Layer 1: Participation signals (Entry readiness)

We measure

- Did the teacher log *anything*?
- Over how many days?

Metrics (Simple)

Metric	Definition	Why it matters
First Login Lag	Day of first login (Day 1–21)	Early entry ≠ better teacher; late entry ≠ disengaged
Active Days	# of days with login	Indicates willingness to stay in loop
Silent Days	Login without task	Trust-safe; shows presence

Interpretation (Canonical)

- Participation ≠ commitment
- Non-participation ≠ resistance

This layer only answers:

"Is this teacher reachable through low-friction nudges?"

Layer 2: Consistency signals (Habit formation)

We measure

- Regularity, not volume
- Spread, not streaks

Metrics

Metric	Definition
Active Day Ratio	Active days ÷ 21
Gap Pattern	Max consecutive missed days
Return After Gap	Yes / No

Interpretation Rules

- 6–8 active days with gaps = **healthy realism**
- Perfect streaks = often compliance-driven rather than reflective
- Returning after a gap = **strong readiness signal**

Consistency is not daily discipline. It is willingness to return.

This layer tells us:

"Can this teacher sustain reflective practice without enforcement?"

Layer 3: Task stretch signals (Readiness to grow)

Bringing back the **task importance**

Task risk bands (Internal Only)

Band	Tasks	Why
Low-risk (Self)	1, 5, 12	Private, low exposure
Medium-risk (Classroom)	2, 3, 4, 6, 7, 8, 11	Visible to students
High-risk (Social)	9, 10	Peer / parent exposure

We measure

Metric	Definition
Band Spread	Does teacher stay only in low-risk?
Upward Stretch	Any movement to medium/high?
Voluntary Repeat	Repeating high-risk tasks

Interpretation Rules (Non-negotiable)

- Low-risk dominance = **safety building**, not stagnation
- One high-risk task = **big signal**
- No high-risk ≠ not ready
- Early high-risk ≠ advanced teacher

This layer answers:

"What kind of support does this teacher need next?"

Trajectory profiles (Internal routing only)

Not levels. Not scores. Profiles.

Profile A: Entry-ready

- Logged ≥3 days
- Mostly low-risk tasks
- Gaps present

Next intervention:
Guided reflection, no complexity increase

Profile B: Habit-forming

- Logged 6–8 days
- Returned after gaps
- Mix of low + medium-risk tasks

Next intervention:
Structured observation → action loop (MI-1)

Profile C: Stretch-Ready

- Logged ≥7 days
- At least one high-risk task
- Voluntary repeats

Next intervention:
Diagnostic practice depth activation (D1→D2)

Profile D: Peripheral

- Logged ≤2 days
- No task stretch
- Long gaps

Next intervention:
Do nothing yet
Re-enter via leadership or peer narrative

Silence is data.
Non-participation is also a signal-**but not a deficit**.

Used For (and what it is NOT)

Used for:

- Playbook branching
- Intervention intensity decisions
- Mentor / facilitator bandwidth planning
- Designing MI-1, MI-2, MI-3

NOT used for:

- Teacher comparison
- SRI scoring
- External reporting
- Performance judgement

Early micro-intervention data is used to understand *trajectory readiness*, not practice quality.
It informs *what support to offer next*, not *how teachers are performing*.

What we will analyse (Scope control)

From the table *Micro-Tasks → SRI Signal Types → Readiness Constructs*, the micro-task data contributes **only to**:

SRI signal types

- Orientation Signals (FP1–FP5)
- Practice Trajectory Signals (early reflection & logging)
- Validation Signals (limited, via parent touchpoints)

SRI readiness constructs impacted

- Intent Readiness
- Practice Readiness (early trajectory only)
- Ecosystem Readiness (weak, directional)

No claims are made about Capacity Readiness or System Readiness from this data. This boundary is critical.

Analysis layer 1: Orientation is observed, not assumed

Micro-tasks reveal (200-teacher sample)

Instead of asking *"Do teachers value FP1–FP5?"*, SRI can now say:

- Which **Foundational Principles teachers naturally orient toward** when given low-risk choice
- Where intent is **latent but not activated**
- Where intent is **situational**, not ideological

Example patterns (Illustrative)

- FP1 (Every Child is Unique)
  High uptake via:

- Task 1 (Notice one learner)
- Task 11 (Student voice)

  → Indicates *learner-sensitivity intent*, even in low-resource classrooms

- FP4 (Assessment for Learning)
  Moderate uptake via:
  - Task 4 (Ask why/how)
  - Task 7 (Quick check)

    → Suggests *assessment intent exists*, but depth is likely procedural
- FP5 (Collaboration)
  Lowest uptake via:
  - Task 9 (Teacher touchpoint)
  - Task 10 (Parent signal)

    → Confirms known constraint: collaboration intent is fragile without system support

This makes SRI more honest as

Orientation signals are no longer:

- inferred from survey agreement, or
- overstated through policy familiarity

They are **revealed through voluntary action**.

Analysis layer 2: Practice Readiness as Trajectory

We do not analyse *how well* a task was done.
We analyse:

- whether teachers re-enter the practice loop
- whether reflection leads to small action
- whether behaviour changes are attempted

Across sample size of 200 teachers, SRI can now surface:

- Distribution of **practice engagement trajectories**
  - one-time experimenters
  - intermittent returners
  - early habit-formers
- Evidence that:
  - reflection → action loops are *possible*
  - but not yet *stable or diagnostic*

This data supports the conclusion that **practice readiness exists at D1/D2 levels**, but progression to D3/D4 requires targeted intervention.

This is **far more precise** than generic statements like "teachers need training".

Analysis layer 3: Mismatch patterns become visible

Because micro-tasks are **FP-mapped**, SRI can now show:

Example Mismatch Insights

- Strong FP1 orientation + weak FP4 enactment
  → Learner care without assessment depth
- High reflection logging + low collaboration tasks
  → Individual readiness constrained by system culture
- Consistent classroom-level actions + no parent signals
  → Ecosystem readiness lag

These mismatches are **explicitly predicted** in the SRI hypothesis and now **empirically visible**.

Analysis layer 4: Ecosystem signals without overclaim

Even limited participation in:

- Task 9 (peer sharing)
- Task 10 (parent signal)

allows SRI to say:

- Ecosystem readiness is **emergent, not absent**
- Trust exists, but **conditions are uneven**
- Collaboration requires **design support**, not exhortation

This avoids the common error of declaring:

"Parents are not engaged"
when the real issue is **teacher safety and system permission**.

Strengthening SRI through micro tasks

1. Reduces false precision

- No scores added
- No micro-task weighting
- No artificial aggregation

2. Preserves SRI guardrails

- Early signals not over-weighted
- Contradictions treated as insight
- Trajectory prioritised over point values

3. Improves Actionability

SRI can now answer, with evidence: "What kind of NEP-aligned change is possible *next* in this school and why?" It will not answer: "How good is this school?"

SRI Reporting

Internal SRI v1 (myelin design)

- Included as **Orientation & Early Practice Evidence**
- Used to justify **micro-intervention design**

- Linked to readiness construct narratives

External / Stakeholder SRI Report

- Referenced **descriptively**, not analytically
- Used to explain *how readiness was interpreted*
- Not presented as a dataset or chart

"Early micro-intervention participation data was used to ground orientation and practice readiness interpretations in observed teacher behaviour over time, without treating these signals as indicators of instructional quality or impact."
